

DOCUMENT MANAGEMENT

The Benefits of Document Management in The Healthcare Industry

Imagine an office where files and records are available instantly with a simple click of a button, where paper waste is at a minimum, and an entire patient's history fits on a single CD. These possibilities and more await those ready to take advantage of new advancements in healthcare technology.

As gratifying as this sounds, however, a fully computerized electronic patient record remains out of reach for many organizations, leaving a partial electronic health record as the ultimate vision of many healthcare providers. As a result, today's growing trend is to look at document imaging as a bridge to achieving the vision of a paperless office.

Document imaging helps physicians and caregivers transition from a paper-based retrieval method to accessing the same information online. And along with improved workflow capabilities over a paper record, there are many tangible improvements that organizations can realize by embracing the benefits of document imaging as part of an electronic health record plan. In addition to providing better care for patients with improved access to their data, your organization will operate better both efficiently and financially in today's competitive healthcare marketplace. Duplicate your success with document imaging.

Features of Document Imaging:

- Establish HIPAA requirements
- Integrate paper-based forms into patients' electronic health records
- Manage millions of documents and retrieve the right one in seconds
- Share documents with colleagues while protecting confidential information
- Prepare for disaster recovery with redundant backups
- Improve EOB and remittance processing
- Shorten coding/accounts receivable processing time
- Lower paper overhead costs
- Reduce off-site storage costs

Now is the time to improve document management within your organization. HealthConnection is ready to help—we're only a phone call away.
